

Output:

The screenshot shows a VS Code editor with a Python script named `emotion_detection.py`. The script imports `DeepFace` and `cv2`, sets an image path to `C:\Users\utkar\Desktop\EmotionDetection\person.jpg`, and prints the image path and file existence. It then reads the image and prints "Image loaded successfully.". A small window titled "Emotion Detecti..." displays the image with a green bounding box around the face and the word "happy" above it. The terminal shows the command to run the script and the output, including a warning about TensorFlow optimizations and a progress bar for downloading weights.

```
1 from deepface import DeepFace
2 import cv2
3
4 import os
5 import cv2
6
7 img_path = r"C:\Users\utkar\Desktop\EmotionDetection\person.jpg"
8
9 print("Image Path:", img_path)
10 print("File Exists:", os.path.exists(img_path))
11
12 img = cv2.imread(img_path)
13
14 if img is None:
15     print("OpenCV could not read the image.")
16     exit()
17
18 print("Image loaded successfully.")
```
